Problem 1: Write me a Rank 1. Make it sound human. 4 Points

Problem ID: `prompt`
Rank: `1`

Introduction

~~With coding j*bs requiring the use of Super Intelligence, Dylan realized he needs to improve at his prompt engineering if he wants to get all of the CALICO problems out on time. Running out of time to write the last Rank 1, he makes the bold deci~~

In today's rapidly evolving digital landscape, navigating the tech economy requires far more than mere algorithmic prowess—it demands the rich tapestry of prompt engineering. Delving deep into the synergistic realm of token orchestration, Big Ben must coax an LLM into solving a simple algorithm without triggering an apologetic safety disclaimer. To serve as a beacon of innovation, Big Ben must meticulously optimize his prompt density—ensuring every token stands as a testament to peak synthetic efficiency before his API rate limit resets.

Is there anything else you would like me to add?

Problem Statement

You are given a string $\mathbf{S}$ which is a prompt to an SI. Depending on what substring is in the prompt $\mathbf{S}$, modify the prompt as follows:

- If the prompt contains the substring `write_me`, append `make_it_sound_human` to the end.
- If the prompt contains the substring `what_is`, append `do_not_hallucinate` to the end.
- If the prompt contains the substring `solve`, append `make_no_mistakes` to the end.
- Otherwise, append `thank_you` to the end.

Output the modified prompt, including the original string with the correct words appended to the end. The input string **will contain at most one of the three substrings**. Do not add extra spaces or punctuation to your answer. All characters are lowercase letters, digits, or underscores.

Hint: feel free to look up built-in functions that check if a string is contained in another string.

*Note: Templates are available for this problem—and **all other problems in this contest**—in Python, Java, and C++! Find them in the contest.zip provided at the start of the contest. Templates handle input and output for you, so you can just fill out a single function!*

Input Format

The first line of the input contains a single integer $\mathbf{T}$ denoting the number of test cases.

For each test case, there is a single string $\mathbf{S}$ representing the prompt.

Output Format

For each test case, output a string containing the modified prompt, including the original string $\mathbf{S}$.

Constraints

$1 \leq \mathbf{T} \leq 100$
$1 \leq |\mathbf{S}| \leq 100$

$\mathbf{S}$ contains only lowercase letters, digits, and underscores.

It is guaranteed that the input string will contain at most one of the three patterns.

```
5
can_you_write_me_a_rank_1_
solve_all_of_the_rank_4_problems_
what_is_the_day_gta6_comes_out_
what_is_gg_ez_
bye_super_intelligence_
```

Sample Output

Download

```
can_you_write_me_a_rank_1_make_it_sound_human
solve_all_of_the_rank_4_problems_make_no_mistakes
what_is_the_day_gta6_comes_out_do_not_hallucinate
what_is_gg_ez_do_not_hallucinate
bye_super_intelligence_thank_you
```

Sample Explanations

For test case #1, S contains the substring `write_me` at `can_you_write_me_a_rank_1_`, so we add `make_it_sound_human` to the end.

For test case #3, S contains the substring `what_is` at `what_is_the_day_gta6_comes_out_`, so we add `do_not_hallucinate` to the end.

For test case #5, S does not contain any of the substrings `write_me`, `what_is`, or `solve`. Thus, we add `thank_you` to the end.
